

Trail Data Console

Pacific Crest Trail

Operator's Guide

Awareness on the wall. Authority in the workflow. Receipts for everything.

THE NOC WALL · LIVE CONSOLE · SHOT JUNE 2026

Appalachian Trail · 2,185 mi

Pacific Crest Trail · 2,653 mi

Continental Divide Trail · 2,980 mi

WHAT'S INSIDE

- 01 Browserless. Everywhere. — no app, no map packs, ever
- 02 Sign In & Orientation — magic links, roles, your conservancy
- 03 Alerts — the workflow surface; the two-person publish
- 04 Baseline & Revisions — the data of record
- 05 Trail Map & the Farrah View — real elevation, tally toasts
- 06 The NOC Wall — the whole trail on three screens
- The Honest Console — real vs. sample, care & feeding

Browserless. Everywhere.

One install, ten seconds — and even the install is optional.

- The title bar reads **Triple Crown Trek Planner** — not a browser. Installed, it runs in its own window, with its own icon in the taskbar and the Dock
- On iPhone: **Share → Add to Home Screen**. Ten seconds. The icon lands top-left like any app — because it is one
- On the desktop, the shortcut opens the very same app, pixel for pixel. **One build. Every device. Identical.**
- **NO APP STORE. NO MAP PACKS. NOTHING TO DOWNLOAD — EVER.** 7,800+ miles of trail data ship inside the app itself
- Offline by architecture, not by feature: the file *is* the app. It works at the trailhead, in the canyon, in airplane mode

IN ITS OWN WINDOW · ICON IN THE TASKBAR

ILLUSTRATION · THE INSTALL STORY — SEE THE
ADD-TO-HOME-SCREEN GUIDE

NO APP · NO MAP PACKS · NOTHING TO
DOWNLOAD — EVER

Sign In & Orientation

Magic links, roles, and your conservancy — no passwords, no friction.

- **Magic-link sign-in** — enter the email you were invited under; tap the link; you are in
- **Two roles:** editors work their own conservancy; superadmins see all three, with a selector in the top bar
- The whole console follows the selected conservancy — trail, data, guides, and maps switch together
- Official names, used everywhere: this is the **admin_console**; the public hiker app is the **hiker_console**
- Two doors, two surfaces: what you publish here is what hikers see there

The screenshot shows the 'Trail Data Console' interface. At the top right, there is a button labeled 'PCTA · PCT'. The main section is titled 'Sign in' and contains a text input field with the placeholder 'you@conservancy.org'. Below the input field is a dark blue button labeled 'Send magic link'. Underneath the button, a line of text reads 'For authorized conservancy editors · no passwords, ever'. At the bottom of the interface, there is a yellow pill-shaped button labeled 'SUPERADMIN' followed by the text 'All conservancies'.

Alerts — the Workflow Surface

Draft it. Second-key it. Ship it to every phone on the trail.

- **Draft → publish, two-person rule:** an alert drafted by one editor must be published by a second — no single hand on the lever
- **HAZARD fast path** for emergencies, still attributed and logged
- Every alert carries its byline: “Posted by PCTA via Triple Crown Trek Planner”
- Published alerts surface instantly in the hiker_console — the planner *and* the On-Trail View
- When any map, counter, or toast offers a “full report,” **this page is where it lives**

Baseline & Revisions

The data of record — typed waypoints, full history, honest reversals.

- **Baseline** holds the typed waypoint inventory: shelters, water sources, road crossings, named waypoints
- This inventory is what lights the maps up *for real* — every drop and tent traces back here
- **Revisions** records who changed what and when — the before and the after
- One-tap **revert** restores any prior state; nothing is ever silently lost
- Edits ride the same two-person discipline as alerts

Trail Map & the Farrah View

The accordion is the index. The On-Trail View is the magazine.

- One row per state — mileage plus rollup counts; tap any icon for a **tally toast**, in place. The law of the house: **a glance is a toast; the full report is the Alerts tab**
- Open a state and its card drops in, drawn from **real, full-resolution elevation** — and carries a **NOC button** straight to the wall, pre-filtered
- Below: the expanded On-Trail View itself — 4,200 to 13,255 ft of real CDT terrain, every drop, tent, and apple at its mile, live position, one-tap Copy, and the bear banner and conservancy advisory published from *this console*

ACTUAL CONSOLE · THE ON-TRAIL VIEW — FARRAH · JUNE 2026

The NOC Wall

The whole trail on three screens — built to be read from across a room.

- The trail's real elevation runs **continuously across three angled monitors**; dark for the ops room, light for the office
- **STATE chips** scope everything instantly — below, the wall is holding Wyoming: 33 water, 14 shelters, terrain bare everywhere else
- The **Filters pill** opens a checkbox panel with all seven collected types — shown mid-decision, panel open, wall repainting live
- **Counters front and center** — click a counter or any icon for its toast; full reports stay on Alerts

ACTUAL CONSOLE · THE NOC WALL, SCOPED TO WYOMING, FILTERS OPEN · JUNE 2026

Real vs. Sample

The one promise this console keeps before any other.

The elevation is real. Every profile in this console — the state cards, the whole-trail view, and all three panels of the NOC Wall — is drawn from full-resolution elevation data for the Pacific Crest Trail.

The counts are sample, for now. Rollup counts and icon positions are deterministic sample data, and every surface that shows them says so. They go live as the feeds ship: alerts from this console's own publish pipeline, water and shelters from the Baseline inventory, bear sightings and hiker presence from the field. The design does not change when they do — only the truth behind the numbers.

A glance is a toast, in place. The full report is the Alerts tab. Nothing opens a new screen.

Care & feeding. The console deploys as a single file — **admin/trail-data/index.html** — with no service-worker version bump; that tax belongs to the hiker_console at the domain root. And the standing rule, learned honestly: two doors, two files. Never upload one console over the other's path.
