

Triple Crown

Trail Data Console

Conservancy Guide

The conservancy's editing room for the trail itself — shelters, water, road crossings, waypoints, trek mileage, and live hazard alerts — kept honest by a two-person review.

It edits the very dataset the hiker app reads. Draft a change, a second editor approves it, and it publishes to every phone on the next poll. Every edit is logged, diffable, reversible, and exportable — no silent edits, ever.

Appalachian Trail · 2,185 mi

▲ Pacific Crest Trail · 2,653 mi

▲ Continental Divide Trail · 2,980 mi

WHAT'S INSIDE

- 01 The Console** — one window, every trail, two-editor publishing
- 02 Baseline** — the read-only merged view of live trail data
- 03 Editing Entities** — add, edit & retire shelters, water, crossings
- 04 Trek Reroute** — change one segment, cascade the cumulative miles
- 05 The Two-Person Rule** — draft, review, approve & publish
- 06 Trail Alerts** — advisories & hazards, drafted and approved
- 07 Emergency HAZARD** — the fast-path publish + 24-hour escalation
- 08 Revisions & Audit** — every change, diffed, filtered, exported
- 09 Revert** — produce a correct inverse of any published change
- 10 Editors & Roles** — invite editors and approvers per conservancy

The Console

One window for every trail. Conservancy editors **draft** a change, a second editor approves it, and it publishes to every hiker's phone on the next poll — every edit logged, diffable, and reversible.

Four Pages

Baseline, Revisions, Alerts, Editors — the whole job.

Entity Types

Shelters, water, crossings, waypoints & treks — with live counts.

Search & Sort

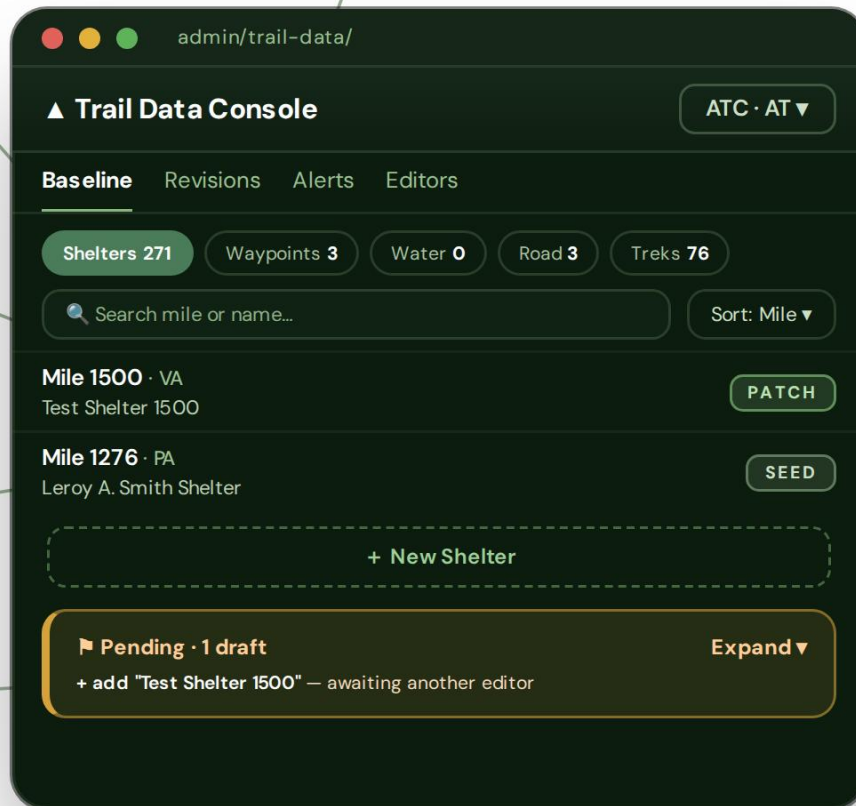

Filter by mile or name; sort either way.

Read-Only View

The merged live state — exactly what the hiker app reads.

Draft a Change

Add, edit, retire or reroute — never a silent write.

One Console, Every Trail

The selector repaints to that trail's data.

SEED vs PATCH

SEED is the shipped baseline; PATCH is a published edit.

Pending Panel

Your drafts gather here until published.

Two-Person Rule

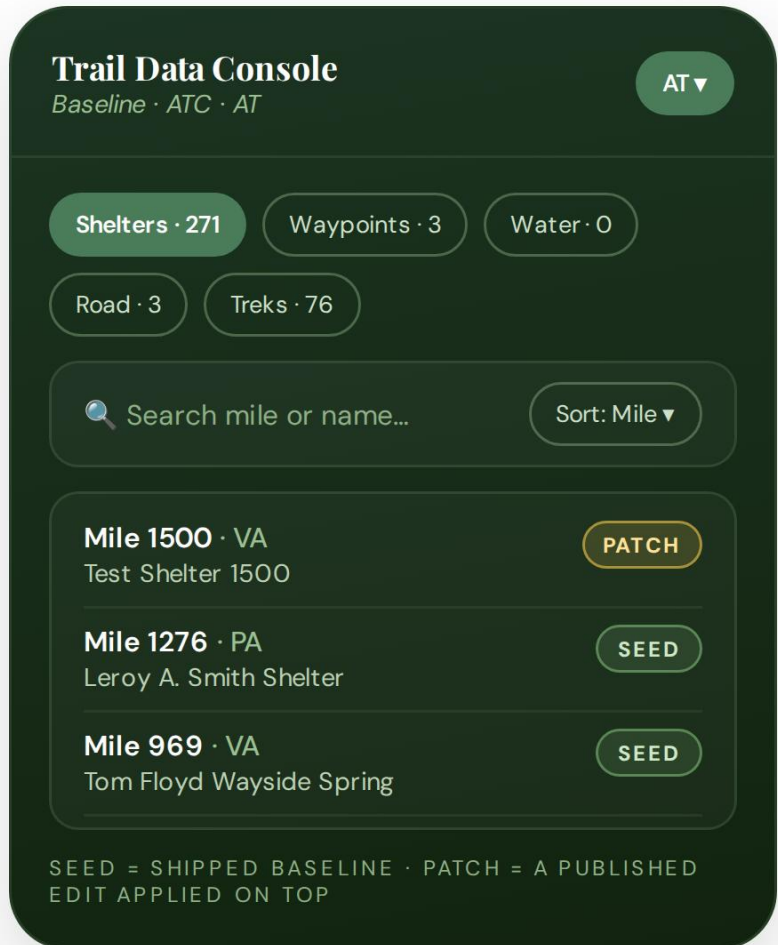

You can't approve your own — a second editor publishes it.

— One console, every trail — two editors to publish, so the map you ship is the map the trail trusts. —

Baseline

The read-only merged view of live trail data — exactly what the hiker app reads.

- Five entity tabs per trail — **Shelters, Waypoints, Water Sources, Road Crossings, Trek Segments** — each with a live count
- The **topbar trail selector** repaints the whole console to that trail (AT · PCT · CDT)
- **Search** by mile or name and toggle **Sort: Mile / Name** to reorder instantly
- Every row carries an **Origin badge: SEED** (the shipped baseline) or **PATCH** (a published edit)
- This view is **read-only** — all writes go through draft & review, never a direct edit
- It is the **merged** state: seed data with every published patch applied on top

Editing Entities

Add, edit and retire shelters, water, crossings & waypoints — every change a reviewed draft.

- **+ New** on any tab opens a form: mile, name, state, and the fields for that entity type
- **Edit** or **Retire** any existing row — each opens the same draft flow
- A **reason of 20+ characters** is required on every change; non-numeric miles are blocked
- Save lands the change in the gold **Pending baseline changes** panel — never live yet
- A **Tell hikers?** card appears after saving — hand off to **Draft an alert** or skip
- Guards are enforced both in the UI and in the database — bad input can't slip through

TELL HIKERS?

A baseline edit is silent. **Draft an alert** if hikers should know now — or **No thanks**.

Trek Reroute

Change one segment's length and the cumulative miles cascade — across both directions.

- **Reroute** on any trek segment opens a modal with a **new length** field
- A **live preview** reports the delta and every segment it shifts — NOBO and SOBO
- One edit can touch **dozens of segments**; it is saved as a single multi-patch revision
- Save stays disabled until you **tick the acknowledgement** that downstream miles shift
- The Pending panel shows the patch count (e.g. **29 patches**) and the first diff lines
- On publish, every downstream cumulative mile updates in the hiker app's planner

Reroute · CDT nobo #8
Creede → Lake City

OLD LENGTH
80

NEW LENGTH
80.5

+0.5 mi

PREVIEW · 29 SEGMENTS, BOTH DIRECTIONS

- nobo Creede → Lake City 980–1060 → 980–1060.5
- nobo Lake City → Sargents 1060–1120 → 1060.5–1120.5
- sobo Colorado Border → Creede 2000–2198 → 2000.5–2198.5
- ...and 26 more

☒ I understand this shifts downstream cumulative miles

Save reroute draft · 29 patches

The Two-Person Rule

Draft, review, approve & publish — you can never publish your own change.

- Every change starts as a **draft** and gathers in the Pending panel
- On your own draft you see only **Edit** and **awaiting another editor** — no Approve button
- A **second editor** opens the draft and clicks **Approve & Publish** to make it live
- **Reject is solo** — any editor can reject a pending draft with a 20+ char reason
- On publish the row's Origin flips **SEED** → **PATCH** and it leaves the Pending panel
- The rule is enforced in the database too — even a direct call raises **"two-person rule"**

✓ Approve & PublishReject

Trail Alerts

Advisories and hazards — drafted, approved, and pushed to the hiker banner.

- Three tabs — **Active** · Pending Approval · Retired — each with a live count
- Three severities — **INFO** · **ADVISORY** · **HAZARD** — sorted hazard-first on the hiker banner
- Title (**0/80**) and body (**0/600**) counters, an optional Source URL, and a 20+ char reason
- Same two-person flow: **Save as draft** → a second editor **Approve & Publish**
- **Edit un-publishes** — an edited alert returns to Pending until re-approved
- Hikers see it within one poll cycle with the conservancy's attribution line

HAZARD

TITLE · 41/80
Footbridge out at Kennebec River ford

BODY · 96/600
Spring runoff took the footbridge; ford or detour via the logging road. Confirmed by ranger today.

Save as draft

Emergency HAZARD

The fast-path publish for active danger — with a 24-hour escalation backstop.

- Selecting **HAZARD** reveals a red note and a **Publish immediately (Emergency)** button
- It publishes straight to **Active**, marked “**Emergency — needs 2nd review**”
- Hikers see the HAZARD at once, sorted above ADVISORY and INFO
- A **second editor** later clicks **Confirm review** — the publisher cannot self-confirm
- If unreviewed past **24 hours**, an escalation email fires to the conservancy contact
- INFO and ADVISORY never get the emergency button — only HAZARD

Active Alerts · AT ×

 **HAZARD · Footbridge out** at mile 2,047.
Emergency — needs 2nd review

Publish immediately (Emergency)

AFTER PUBLISH
A second editor sees **Confirm review**. If 24 hours pass unreviewed, an escalation email goes to the conservancy — the danger never sits silently unverified.

Revisions & Audit

Every published change — diffed, filtered, and exported. Nothing happens off the record.

- Every change appears in **Revisions** within seconds — a reverse-chron log
- Each row opens a **diff**: the reason, who drafted & approved it, and the before → after detail
- Status badges read **published** · **reverted** · **pending** · **rejected**
- **Filter** by kind, editor, and a date window; the “N of M” count narrows live
- **Download CSV** exports the current view — UTF-8, every field quoted, opens clean in Excel
- The export carries patch counts and reciprocal **revert** **cross-link** ids

Revert

Undo any published change with a correct inverse — the merged state returns to exactly before.

- Open any published row and **Draft revert** with a 20+ char reason — it enters review
- A revert is a real revision: the same two-person rule publishes it (or the test sim)
- On publish the original flips to **reverted**; the pair shows ↔ / 🔗 **cross-links**
- A “**Heads up**” note warns if a later edit touched the same entities
- You can’t double-revert — a second attempt reads “**already pending review**”
- An **emergency HAZARD** can be **Retire now** in one step — danger comes down fast

Revision · baseline_update
published

SUMMARY
Reroute CDT nobo #8 · 29 patches

REASON FOR REVERT (20+ CHARS)
Survey corrected — segment is 80 mi, not 80.5; restoring.

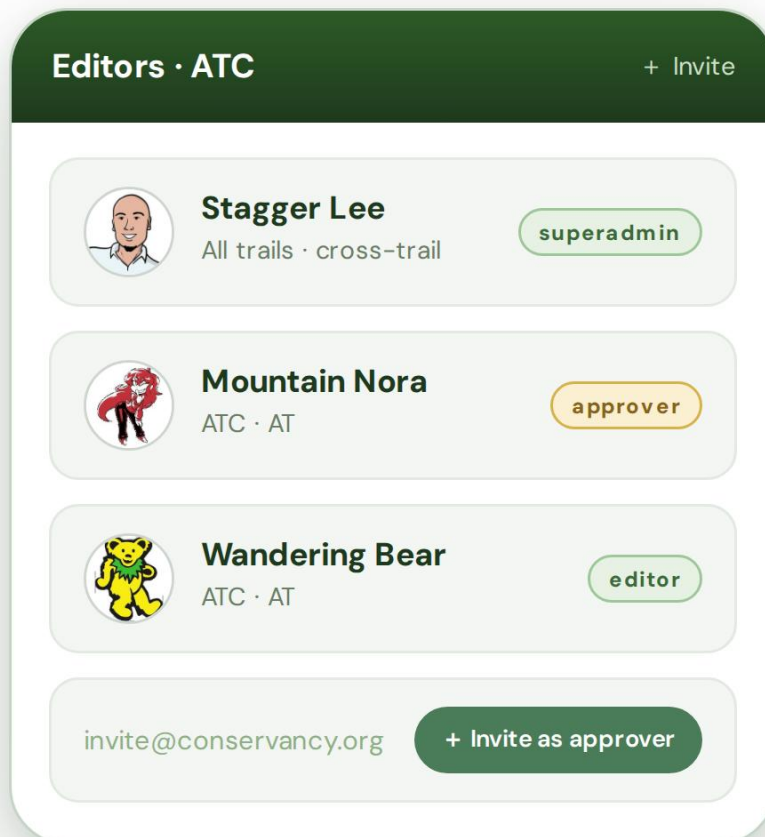

🚩 Heads up — a later edit may touch the same segments. Review before publishing the revert.

↔ Draft revert

Editors & Roles

Invite editors and approvers per conservancy — and the superadmin who spans all three.

- **Invite an editor** by email and assign a role on a specific trail
- An **editor** drafts changes; an **approver** can also Approve & Publish
- Roles are **scoped to a conservancy** — an ATC approver can't publish CDT
- The **superadmin** is the cross-trail exception, by design
- Editor **names** surface throughout Revisions and the CSV audit trail
- Invites are accepted in the invitee's own browser — no shared logins

ABOUT THE CONSOLE

Built for the Stewards

Free for conservancy partners. No ads. The data the trail community depends on, edited in the open.

The Trail Data Console is how the Appalachian Trail Conservancy keeps the AT's data current — the same dataset every hiker's phone reads, edited transparently and published through a two-person review.

Nothing is written silently. Every add, edit, retire, reroute, and alert is a reviewed draft, logged in Revisions, diffable, reversible, and exportable to CSV. The map you ship is the map the trail can trust.

The console is **free for the three Triple Crown conservancies**. Each works only its own trail; the superadmin spans all three so the Triple Crown stays in sync.
